

Global Dashboard

MCP Connection Guide for Collaborators

What You Can Do

By connecting to this dashboard via MCP, you can compare options signals between your own model and this one, sync evaluated trade predictions to improve your RL weights, and merge learned signal weights — all through Claude Code without writing any code.

Prerequisites

You need:

- Claude Code installed — claude.ai/code
- The ngrok URL from your friend (e.g. <https://abc123.ngrok.io>)
- An internet connection

Setup Steps

1

Register the Dashboard

Run this in your terminal. Replace the ngrok URL with the one your friend shared.

```
claude mcp add friend-dashboard \  
  --transport sse \  
  https://<ngrok-url>/mcp/sse  
  
# Replace <ngrok-url> with the URL your friend gave you  
# Example:  
# claude mcp add friend-dashboard --transport sse https://abc123.ngrok.io  
se
```

2 Verify the Connection

Run the command below. You should see ✓ Connected next to friend-dashboard.

```
claude mcp list
```

3 Start Using It

Open Claude Code and ask it to use the dashboard. No commands to memorize.

```
# In a Claude Code session, just ask:  
"Ping the friend-dashboard and tell me its stats"  
"Compare AAPL signals between my dashboard and friend-dashboard"  
"Sync predictions from friend-dashboard and retrain my model"
```

4 Share Your Dashboard (Optional)

If you also run Global Dashboard locally, expose it so your friend can connect too.

```
# Install ngrok: https://ngrok.com/download  
ngrok http 8000  
  
# Share the https://....ngrok.io URL with your friend  
# They run: claude mcp add your-dashboard --transport sse https://....ngrok.io/mcp/sse
```

Available MCP Tools

These tools are available once connected. Claude uses them automatically when you ask questions — you don't need to call them by name.

Tool	What it does
<code>analyze_ticker</code>	Get full options analysis for any ticker (spot, IV rank, P/C ratio, GEX, narrative)
<code>get_signal_weights</code>	See current RL signal weights — which signals the model trusts most
<code>get_backtest_stats</code>	Win rate, bull/bear accuracy, avg return across all evaluated predictions

<code>get_screener_results</code>	Top bullish and bearish stock picks from the multi-factor screener
<code>get_reversal_signal</code>	Reversal direction + confidence score for a ticker
<code>compare_with_peer</code>	Side-by-side signal comparison between two dashboards for the same ticker
<code>sync_peer_predictions</code>	Import a peer's evaluated trades to expand your training dataset
<code>merge_peer_weights</code>	Blend RL signal weights from both dashboards (weighted by sample count)
<code>run_rl_training</code>	Re-run the RL optimizer — call this after syncing predictions
<code>ping_peer</code>	Check if a peer dashboard is online and get its stats

Example Prompts for Claude

Compare signals	<i>"Compare NVDA between my dashboard and friend-dashboard. Do we agree on direction?"</i>
Sync + retrain	<i>"Sync predictions from friend-dashboard and run RL training to update my weights"</i>
Weight merge	<i>"Merge my signal weights with friend-dashboard's and show me what changed"</i>
Quick check	<i>"Ping friend-dashboard and tell me their win rate and signal count"</i>
Analysis	<i>"Analyze AAPL on friend-dashboard — what's their IV rank and max pain?"</i>

Privacy & Security

What IS shared	Ticker, timeframe, direction, actual return %, correct/incorrect
What is NOT shared	Account data, personal info, raw price history, API keys
Who can connect	Anyone with the ngrok URL — only share with people you trust
Session expiry	Free ngrok URLs change each session; paid plans give fixed URLs

Troubleshooting

✗ Connected shows error	The dashboard may be offline or the ngrok URL has changed. Ask your friend for a fresh URL.
Tools not appearing	Run <code>claude mcp list</code> again. If still missing, remove and re-add: <code>claude mcp remove friend-dashboard</code>
Comparison returns error	The ticker may not have options data. Try a large-cap stock like AAPL or SPY first.
Sync imports 0 records	The peer dashboard needs evaluated predictions first. Ask your friend to run Force Evaluate in their Backtest tab.
